

The cytoactiv[®] test: Certitude concerning your health

When is cytoactiv[®] applied?

- While you are having your regular check-up for cancer prevention
- While seeing your physician for a check-up, ask about the cytoactiv[®] test.

Why cytoactiv[®]?

- cytoactiv[®] recognizes if your body successfully fights the HPV virus or if there is the risk of further development into actual cancer of this early precancerous stage.
- cytoactiv[®] is simple, fast and reliable

What is your advantage?

- cytoactiv[®] doesn't leave you in doubts
- cytoactiv[®] offers a reliable answer about the course of the disease
- cytoactiv[®] avoids unnecessary surgical interventions

cytoactiv[®] provides you with the certainty to do everything right.!

Make the right decision concerning your health now!

Cancer prevention at the highest level

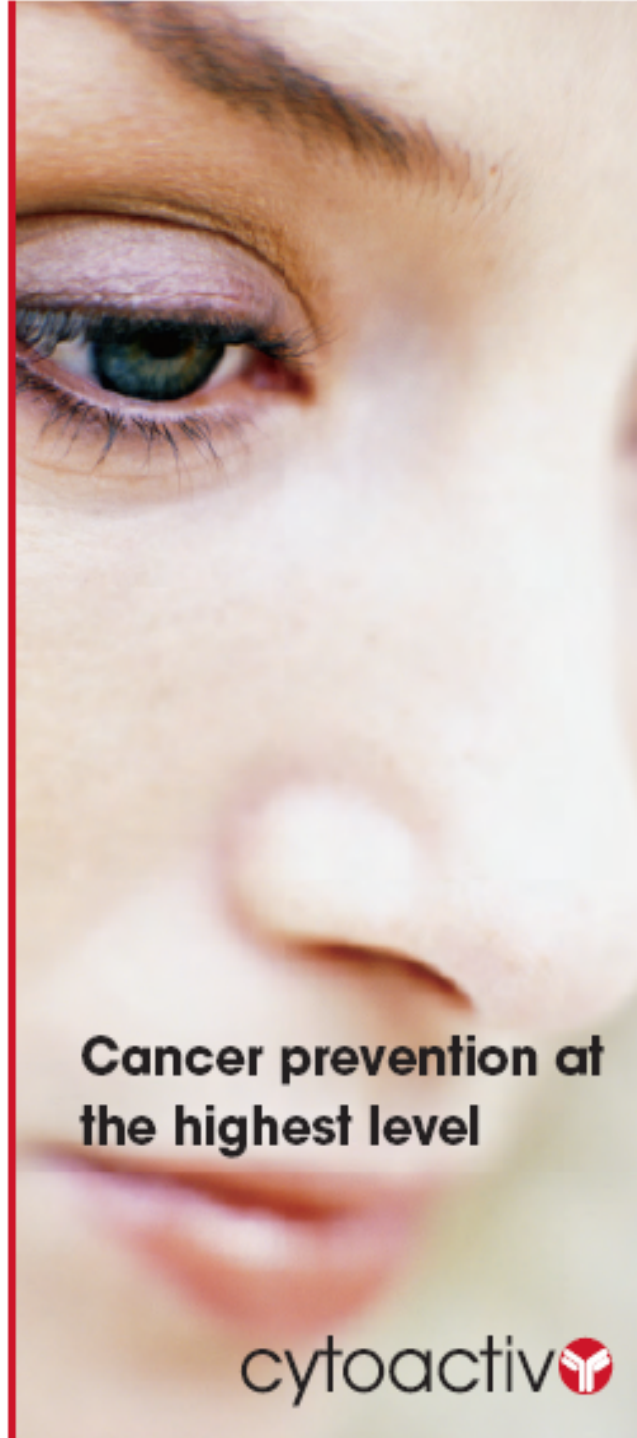

Take the first step for more security and certitude and have your risk checked to get cervical cancer.

Your physician will inform you about the possibilities of the cytoactiv[®] test.

Cancer prevention at its highest level

Dear Patient,

the yearly cancer prevention tests (pap smear, etc.) have largely contributed to the reduction of cervical cancer.

While taking the test, cells are obtained by Pap smear. The Pap test examines these cells.

If changes in the cell structure are detected there is the risk of a precancerous stage.

The Pap test is very efficient and has largely contributed to reduce the frequency of cervical cancer.

In Europe alone, approximately 2.3 million cases of cell changes are detected through the annual check-up for cancer prevention.

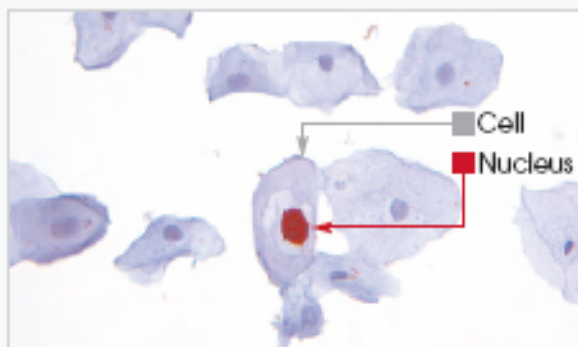

As you can imagine, the diagnosis of a precancerous stage generates in these women the fear about chances for cure.

Now the physician can make a reliable statement about the course of the disease using the cytoactiv[®] test.

cytoactiv[®] provides you with the certainty to do everything right!

The cytoactiv[®] test: Certitude concerning your safe-being

In most cases responsible for cervical cancer are the human papillomae viruses (HPV). The cytoactiv[®] test allows your physician to make a reliable prediction if an infection with HPV will remain without consequences or may result in cervical cancer.

- If the cytoactiv[®] test of the smear shows cells stained red - like in this example - the nucleus of the cell contains a characteristic protein for auto-healing.

This protein stimulates the body own immune system of the patient and generates a healing process.

cytoactiv[®] provides you with the certainty to do everything right!

This is how the cytoactiv[®] test functions

The cytoactiv[®] test detects a specific protein which plays an key role in the fighting against the HPV infection.

If this protein is present, the body successfully fights against the infection and will be cured with high probability.

If your cells don't generate this protein, special attention should be paid to under certain conditions.

The earlier the cytoactiv[®] test is used, the more certitude you gain to do the right thing. This way you can keep your risk at getting cervical cancer as small as possible.

Your physician knows what steps to take and will advice you accordingly.

cytoactiv[®] provides you with the certainty to do everything right!
